Gamma-glutamyl transferase (GGT) has been detected in coronary plaques. However, the association between serum GGT levels and coronary atherosclerotic plaque vulnerability in patients with coronary artery disease (CAD) as detected by optical coherence tomography (OCT) has not been investigated.

The relationship between liver enzymes and clustered components of metabolic syndrome (MetS) is explored and the predictive power of  $\gamma$ -glutamyl transferase (GGT) for the diagnosis of MetS in an adult population in Beijing is investigated.

For the stratified analyses, quintile of serum GGT was used for statistical stability. For a comparison with serum GGT, we reanalyzed the association between serum alanine aminotransferase (ALT), a more liver-specific enzyme, and serum CRP.

To examine the association of serum gamma glutamyl transferase (GGT) to incident heart failure. Methods and Results We related serum GGT to the incidence of heart failure in 3544 (mean age 44.5yrs; 1833 women) Framingham Study participants who were free of heart failure and myocardial infarction.

It may be concluded from the study that a correlation exists between GGT and insulin resistance markers (fasting Insulin and HOMA-IR). This observed correlation indicates that monitoring GGT along with insulin levels in obese children might serve to help prevent the development of diabetes in these children.

Background: Gamma glutamyl transferase (GGT) is a liver enzyme that is involved in oxidative stress. The association between GGT levels and diabetes complications such as microalbuminuria, retinopathy, and peripheral polyneuropathy is a challenging subject.
